

Product Information

iNurse

Purpose

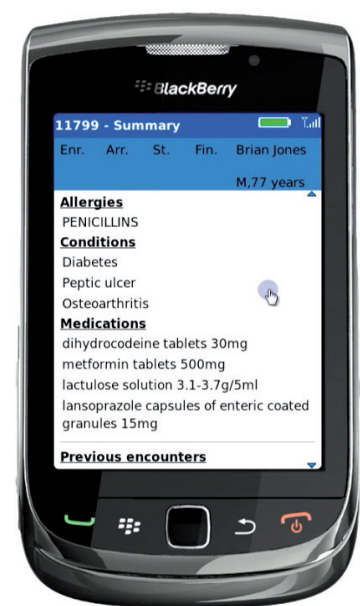

iNurse is a patient management system which enables community clinicians to record and communicate patient care information using either a Windows Mobile or BlackBerry device.

Key benefits

- improves efficiency and productivity of clinical teams by reducing paperwork, duplication of data input and unnecessary travel to base
- increases patient facing time, enabling clinicians to visit more patients and/or spend more time with individual patients
- mature and proven product giving credibility and peace of mind
- highly secure – data is not stored on the device and is always encrypted for transmission
- designed to meet CFH Information Governance standards
- integrates with third-party clinical systems (eg. RiO, SystmOne and Aداstra)
- improves communication within and between clinical teams
- effective workload management and tracking by team leaders
- collects rich management reporting information
- highly customisable, to meet the needs of a broad range of community services

Main features

- receives patient referrals and manages case distribution and scheduling
- provides patient details, medical history and key reference data
- independent of clinical systems, but has the ability to integrate with them (eg. RiO and SystmOne), selecting from and returning data to the existing clinical system
- provides monitoring of case transmission and clinicians arrival status, recording consultation notes and agreed outcomes

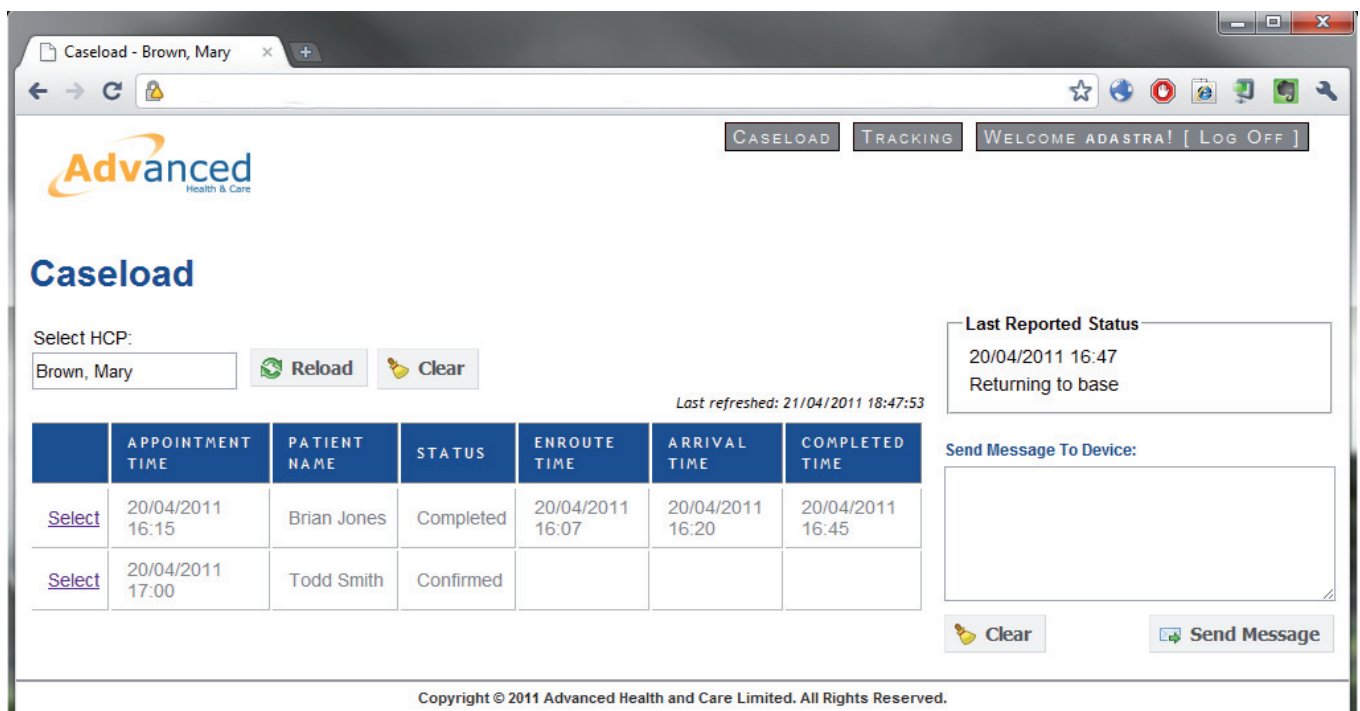

Product Information

- ability to update care plans and complete assessments
- messages back to GP applications
- offers extensive reporting
- links to third-party products (eg. digital pen, satellite navigation and lone worker)

Receives patient referrals and manages case distribution and scheduling

iNurse is suitable for both planned and unplanned care and patient referrals can be received in many ways from a variety of care providers. iNurse enables referrals to be entered manually or received directly from the back office system directly to the mobile device. Using the iNurse Manager facility, cases can be distributed appropriately amongst clinical teams and scheduled appointments can be forwarded directly to clinicians.

iNurse provides a clear audit of cases successfully despatched and received, enabling team leaders to easily monitor the status of cases and clinical visits.

Provides patient data, medical history and key information

As a highly configurable product, iNurse allows clinicians to choose and specify what information they need transmitted to the hand-held device, ensuring that the Clinician out in the field has all the appropriate information they need at the touch of a button. Patient demographics and medical histories including medication and allergies are just some of the key pieces of information that can be transmitted directly to iNurse.

Integration with third-party Clinical systems

iNurse integrates with a variety of clinical systems including RiO, Adatastra and SystemOne, extracting patient data from the clinical system, sending it directly and securely to the mobile device and returning it if it is updated in the field, back to the clinical system. The benefits of this are considerable, avoiding the need for clinicians to travel to an office or base in order to review or update patient records. Everything they need is on the mobile device.

Whilst iNurse links to many third-party clinical applications, it is independent of the National Programme providers, thus making it extremely quick and easy to deploy and configure.

Recording consultation notes and agreed outcomes

iNurse also allows clinicians to record clinical notes using either free text or fast text. Aimed at increasing efficiency, fast text allows the user to choose from a series of predefined drop-down statements that can easily be edited to meet their specific requirements. Having carried out a specific care activity, the clinician can simply select an appropriate outcome, from the predetermined drop-down options and choose what needs to happen next.

Ability to update care plans and assessments

iNurse allows structured questions and assessments to be configured so that users can capture any combination of data on their device and update care plans appropriately. Users have the option to add text to structured data sets or to select from predefined care or even admin activities to record their actions whilst with the patient. This information can be extracted from and delivered to the back office clinical solution, such as Adatastra, RiO and SystemOne.

Messaging back to GP systems

Designed and developed by the award winning Advanced Health & Care Development team, iNurse links to all the existing GP systems and allows messages to be sent to their systems advising of any key activities that have taken place with their patients.

Extensive reporting

iNurse also offers an unparalleled reporting capability, providing a standard set of carefully considered reports as well as the functionality to customise and filter searches on data collected. Throughout the patient case flow, appropriate data collection methods have been applied to ensure an accurate account of patient care and team activity is recorded.

Product Information

Links to third-party applications

Adding further value to iNurse, Advanced Health & Care has also joined forces with a number of complimentary partners to offer integrated lone worker, satellite navigation and digital pen solutions; thus providing community clinicians with the key tools necessary to complete their jobs safely and effectively whilst out in the field.
